Development of technical codes

The Communications and Multimedia Act 1998 (‘the Act’) provides for Technical Standards Forum designated under section 184 of the Act or the Malaysian Communications and Multimedia Commission (‘the Commission’) to prepare a technical code. The technical code prepared pursuant to section 185 of the Act shall consist of, at least, the requirement for network interoperability and the promotion of safety of network facilities.

Section 96 of the Act also provides for the Commission to determine a technical code in accordance with section 55 of the Act if the technical code is not developed under an applicable provision of the Act and it is unlikely to be developed by the Technical Standards Forum within a reasonable time.

In exercise of the power conferred by section 184 of the Act, the Commission has designated the Malaysian Technical Standards Forum Bhd (‘MTSFB’) as a Technical Standards Forum which is obligated, among others, to prepare the technical code under section 185 of the Act.

A technical code prepared in accordance with section 185 shall not be effective until it is registered by the Commission pursuant to section 95 of the Act.

For further information on the technical code, please contact:

Committee representation

This Technical Code was developed by Fixed and Wireless Terminal Working Group under the Malaysian Technical Standards Forum Bhd (MTSFB) which consists of representatives from the following organisations:

Celcom Axiata Berhad
Digi Telecommunications Sdn Bhd
Fraunhofer IIS
Maxis Communications Berhad
Measat Broadcast Network Systems Sdn Bhd
Redsun Engineering Sdn Bhd
SIRIM QAS International Sdn Bhd
Telekom Malaysia Berhad
TM Research and Development Sdn Bhd
YTL Communications Sdn Bhd
Foreword

This technical code for the Specification for Short Range Devices - Specifications (‘this Technical Code’) was developed pursuant to section 185 of the Act 588 by the Malaysian Technical Standards Forum Bhd via Fixed and Wireless Terminal Working Group.

This Technical Code was developed for the purpose of certifying communications equipment under the Communications and Multimedia (Technical Standards) Regulations 2000.

Major modifications in this revision are as follows:

a) Update the frequency bands and maximum transmit power limits for generic and specific SRD applications to be aligned with the latest Class Assignment No. 2 of 2019;

b) Inclusion of technical requirements for new SRD applications such as Ultra-Wideband (UWB), inductive device and automotive radar based on the latest Class Assignment No. 2 of 2019; and

c) Inclusion of new technical requirements for electrical safety and EMC for devices that can be directly connected to the service provider’s network.

This Technical Code cancels and replaces the MCMC MTSFB TC T007:2014, Specification for Short Range Devices (SRD) (First Revision).

This Technical Code shall continue to be valid and effective until reviewed or cancelled.
1. **Scope**

This Technical Code defines the technical requirements for Short Range Devices (SRDs) operating in the frequencies as defined in the relevant Standard Radio System Plans (SRSPs) and the Class Assignments issued by MCMC.

The SRDs may be fixed, mobile or portable stations that are fitted with an antenna connector or an integral antenna. The applications include various generic short range and inductive applications, Industrial Scientific and Medical (ISM), Radio Frequency Identification (RFID), wireless microphone, security, automotive radar, active medical implant and Ultra-Wideband (UWB). The SRDs may employ different types of modulation and power requirement which may include data, video, voice and inductive applications.

2. **Normative references**

The following normative references are indispensable for the application of this Technical Code. For dated references, only the edition cited applies. For undated references, the latest edition of the normative references (including any amendments) applies.

Refer to Annex A.

3. **Abbreviation**

For the purposes of this Technical Code, the following abbreviation applies.

4. Requirements

4.1 General requirements

The SRDs shall be designed to meet the following basic requirements:

a) The SRDs shall not cause interference with other authorized radiocommunication services and be able to tolerate any interference caused by other radiocommunication services, electrical or electronic equipment.

b) The SRDs shall not be constructed with any external or readily accessible control which permits the adjustments of its operation in a manner that is inconsistent with this Technical Code.

c) The SRDs default setting shall be within the frequency range stipulated in SRSPs and Class Assignment.

4.1.1 Power supply

The SRDs may be Alternating Current (AC) or Direct Current (DC) powered. For AC powered equipment, the operating voltage shall be 240 V, ± 5 %, - 10 % and frequency 50 Hz ± 1 % in according to MS 406 or 230 V ± 10 % and frequency 50 Hz ± 1 % in according to MS IEC 60038 whichever is current.

Where external power supply is used, e.g. AC adaptor, it shall not affect the capability of the equipment to meet this Technical Code. Adaptor shall be pre-approved by the relevant regulatory body before it can be used with the equipment.

4.1.2 Power supply cord and mains plug

The SRDs shall be fitted with a suitable and appropriate approved power supply cord and mains plug. Both are regulated products and must be pre-approved by the relevant regulatory body before it can be used with the equipment.

The power supply cord shall be certified according to:

a) MS 2112-5 or BS EN 50525-2-11 or IEC 60227-5 (Polyvinyl Chloride (PVC) insulated - flexible cables/cords); or

b) MS 2127-4 or IEC 60245-1 and IEC 60245-4 (rubber insulated - flexible cables/cords)

The main plug shall be certified according to:

a) 13 A fused plug complying to MS 589-1 or BS 1363-1;

b) 15 A fused plugs complying to MS 1577;

c) 2.5 A, 250 V, flat non-rewireable two-pole plugs with cord for the connection of class II equipment complying to MS 1578 or BS EN 50075.
4.1.3 Marking

The SRDs shall be marked with the following information:

a) supplier/manufacturer’s brand name or identification mark;

b) supplier/manufacturer’s model or type reference; and

c) other markings as required by the relevant standards.

The markings shall be legible, indelible and readily visible. All information on the marking shall be either in “Bahasa Melayu” or English Language.

4.2 Technical requirements

4.2.1 Safety

The SRDs that are directly connected to the service providers’ networks shall comply with the safety requirements defined in MS IEC 60950-1, IEC 62368-1 or any equivalent standards. Please refer to Figure 1 for the illustrations on directly and non-directly connected equipment.

4.2.2 Electromagnetic Compatibility (EMC)

The SRDs that connects (directly or indirectly) to AC mains network and connects directly to the service providers’ networks shall comply with the conducted emission requirements as defined in the ETSI EN 301 489-1 or CISPR 32 or any equivalent standards.

4.2.3 Radio Frequency (RF)

The SRDs shall be designed to operate within the specified frequency bands and comply with the maximum field strength or Radio Frequency (RF) output power and transmitter and receiver spurious emissions given in Table 1. It shall fulfill the relevant requirements of this Technical Code on all the permitted frequencies which it is intended to operate.

</tbody>
</table>

Notes:
1. Effective Radiated Power (ERP) refers to radiation of a half wave tuned dipole, which is used for frequencies below 1 GHz.
2. Equivalent Isotropic Radiated Power (EIRP) is a product of the power supplied to the antenna and the maximum antenna gain, relative to an isotropic antenna, and is used for frequencies above 1 GHz. There is a constant difference of 2.15 dB between EIRP and ERP [EIRP (dBm) = ERP (dBm) + 2.15].

Notes:
1. Effective Radiated Power (ERP) refers to radiation of a half wave tuned dipole, which is used for frequencies below 1 GHz.
2. Equivalent Isotropic Radiated Power (EIRP) is a product of the power supplied to the antenna and the maximum antenna gain, relative to an isotropic antenna, and is used for frequencies above 1 GHz. There is a constant difference of 2.15 dB between EIRP and ERP [EIRP (dBm) = ERP (dBm) + 2.15].
